

## TAKE YOUR RESPONSIBILITY

The Trust Guard security scan not only reveals potential security problems, but also helps you legally demonstrate that you have taken measures to protect your customer data.

How secure is your website?

### Detect security vulnerabilities

Trust Guard is a cloud based solution for detecting security vulnerabilities on your website. Found errors will be classified and explained in a clear and understandable dashboard, including a referral to a solution.

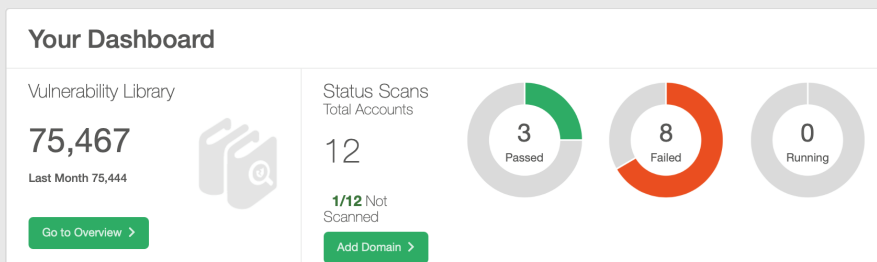

### Comply with specific requirements

By executing the scan frequently you are assuring yourself of an extra tool to continue to comply with standards as PCI DSS, ISO27001, HIPAA, SOX, OWASP and the GDPR legislation.

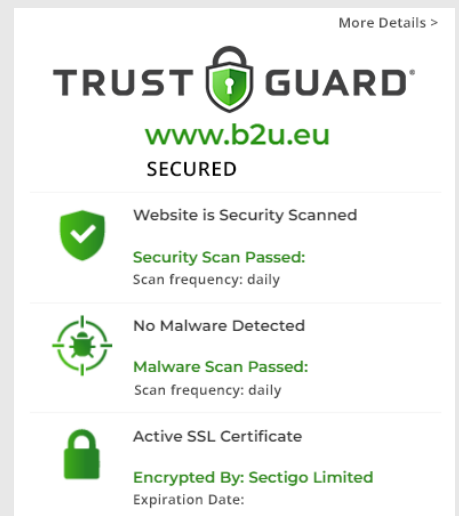

### More traffic = more sales

After the scan is successfully completed, you can add the Trust Guard seal to your website. Your customers will see that you are serious about data security and their trust will increase.

## Every industry has its own security requirements

Protection of personal data is gaining more and more attention. Whereas in the past it was the financial sector that was concerned about the data of cardholders, nowadays all sectors believe that the data of customers, citizens or patients must be handled carefully and securely. All sectors have therefore started working on this themselves, resulting in various security standards.

### PCI DSS

The PCI DSS standard is developed by the major credit card organisations. The goal is to enlarge the control on cardholder details and to decrease credit card fraud.

The vulnerability scan of Trust Guard is executed by a PCI Security Standard Council approved scanning vendor and will, together with the self assessment questionnaire (SAQ), determine if your business is PCI compliant for level 2, 3 and 4.

### GDPR

The GDPR determines how businesses should handle personal details, on a technical and organizational level. The regulations are mandatory since May 2018.

The Trust Guard scan checks if your website and/or network is secure. The report that you can make of this scan can be used to demonstrate that you do everything to comply with the GDPR.

### ISO27001

The ISO27001 standard contains multiple aspects regarding information security, among which system and software development and maintenance. Keeping the ISO27001 certificate is a continuous process.

Trust Guard helps to indicate security risks in compliance with this standard and offers possible solutions.

### OWASP

The mission of Open Web Application Security Project is to give an insight in the safety of specific software, so individuals and organizations can make a deliberate decision about their security.

The security scan of Trust Guard scans multiple vulnerabilities and can generate a report with the findings based on the OWASP Top 10.

### SOX

The SOX-standard is derived from the US senators Paul Sarbanes and Michael Oxley bills. The act is particularly meant for large companies that manufacture and use their own software. The goal of the act is to prevent fraud.

The Trust Guard SOX-report offers insight in internal and external vulnerabilities.

### HIPAA

The Health Insurance Portability and Accountability Act regulates privacy protection in the healthcare sector. Within the Act standards regarding information security are described, in which procedural, technical and physical security measurements are suggested.

With the Trust Guard scan vulnerabilities will be identified and suggestions will be made. Furthermore the HIPAA report offers support to demonstrate you did everything to protect the data.

## Benefits

- Cloudbased solution, no software required
- Scan results available within 1 working day
- Security reports PCI DSS, OWASP, GDPR, ISO27001, HIPAA, SOX
- Price based on scan frequency and number of websites
- Subscription including possible discounts for 1, 2 or 3 years
- Trust Guard seal, free of charge
